```
<h1><center>CS105 Mini-Project</center></h1>
<h2><center>Does who a student is living with effect if and how they work jobs?</center></h2>
```

By: - Anshul Gupta agupt109@ucr.edu - Ali Naqvi anaqv007@ucr.edu - Alex Zhang azhan061@ucr.edu - Nathan Lee nlee097@ucr.edu

1 Pre-Data Questions & Analysis

1.1 What data do we have?

We have data regarding the living situations of students across multiple CS classes. We asked them who they live with, how many people they live with, where they live, whether they work, how much they work, etc. There are a mix of categorical and quantitative datapoints that we will analyze to answer what we want to know:

1.2 What do we want to know?

We want to know how various aspects of a student's home environment go on to affect their employment and school performance. Specifically who they live with and the affects of that.

1.3 Hypothesis & Predictions

- Hypothesis 1: There will be a correlation between whether people live with family, friends, or neither and whether or not they work.
- Hypothesis 2: Students who live on-campus are more likely to have roommates of the same major.
- Hypothesis 3: People who live with more people will have a higher GPA on average.

2 Data Loading & Preprocessing

```python
[1]: %matplotlib inline
     import pandas as pd
     import numpy as np
     import seaborn as sns
     import matplotlib
     import matplotlib.pyplot as plt

     # Load dataframe from data.csv
     df = pd.read_csv("data.csv")
```

```
# Select relevant columns
df = df.iloc[:, [0, 2, 3, 7, 8, 9, 34, 55, 58, 59, 60, 61, 62, 26, 66]]
df
```

[1]:
```
              Timestamp What is your current class standing?  \
0     2/9/2024 20:12:14                                Senior

3 Analysis

```
[5]:  # Count the number of people who work and don't work
      work_counts = df['Do you currently work?'].value_counts()

      # Plotting a pie chart
      plt.figure(figsize=(8, 8))
      plt.pie(work_counts, labels=work_counts.index, autopct='%1.1f%%',␣
       ↪startangle=90, colors=['lightblue', 'lightcoral'])
      plt.title('Distribution of People Who Work and Don\'t Work')
      plt.show()
```

Distribution of People Who Work and Don't Work
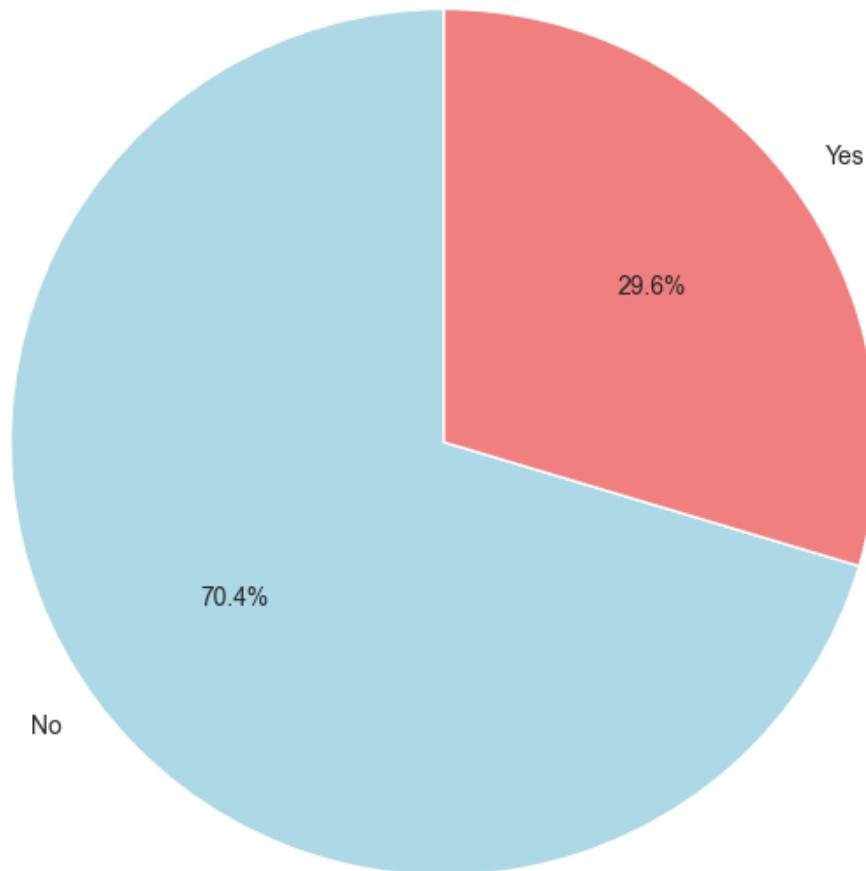

The majority of student respondents (70.4%) do **not** work while attending school.

```
[6]: df_2dhist = pd.crosstab(df.loc[:, 'Do you currently work?'],
                             df.loc[:, 'Do you currently live in a house, apartment,␣
      ↪or dorm?'],
                             normalize='index')

     # Plot heatmap
     plt.subplots(figsize=(8, 8))
     sns.heatmap(df_2dhist, cmap="Blues")
     plt.xlabel('Do you currently live in a house, apartment, or dorm?')
     _ = plt.ylabel('Do you currently work?')
```

```
df_2dhist
```

[6]: Do you currently live in a house, apartment, or dorm? Apartment   Dorm \
     Do you currently work?
     No   0.500000 0.131868
     Yes   0.493506 0.064935

     Do you currently live in a house, apartment, or dorm?   House   Room
     Do you currently work?
     No   0.362637 0.005495
     Yes   0.441558 0.000000
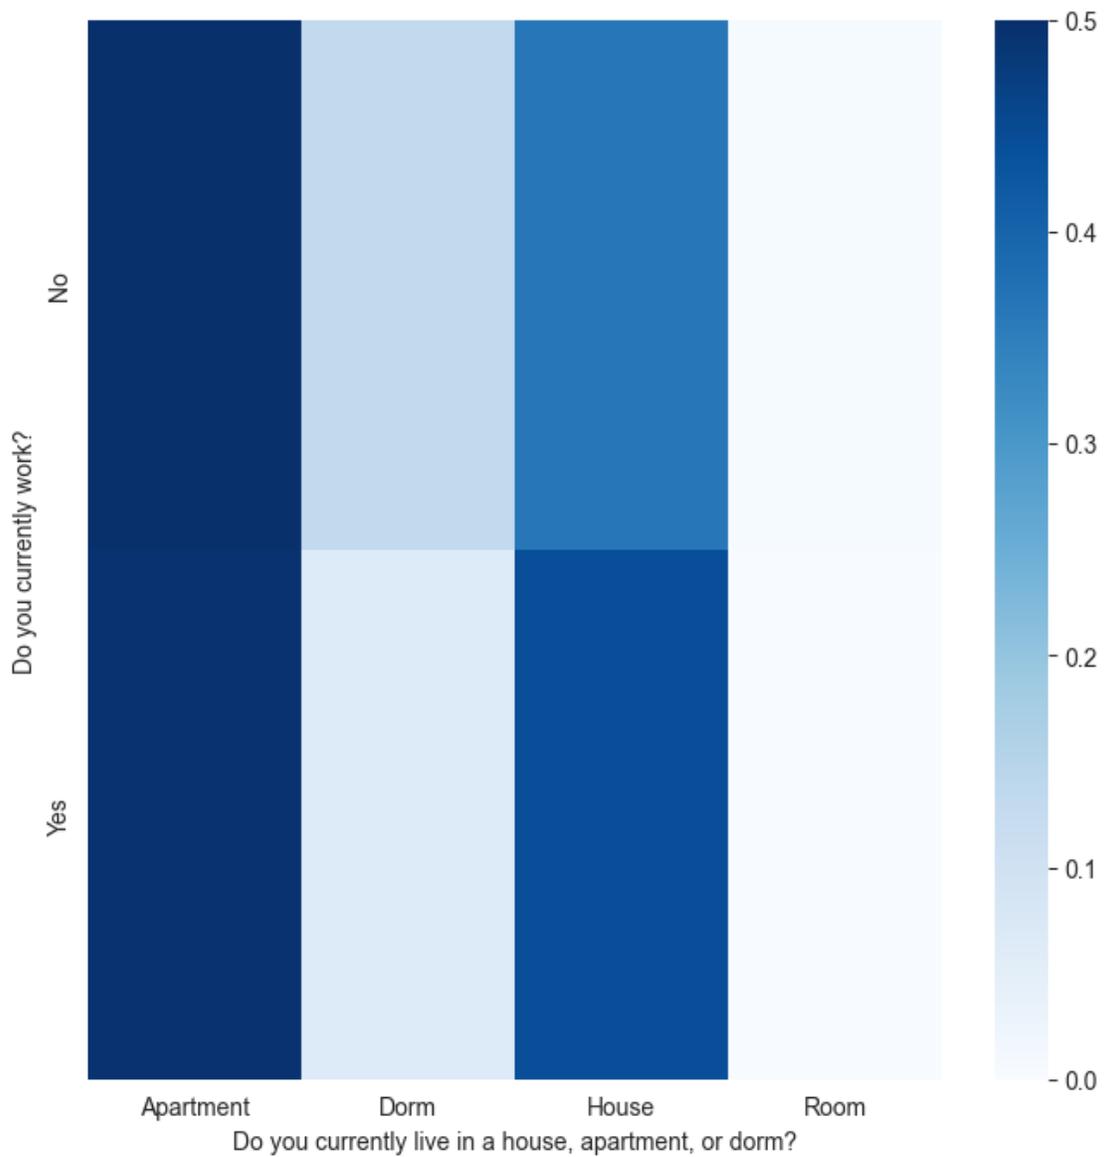

For both working & non-working participants, the proportion who live in an apartment are equivalent (50%).

However, 13% of non-working participants live in a dorm while only 6% of working participants live in a dorm. This 7% drop is matched in participants who live a house, with 44% of working participants living in a house compared to 36% of non-working participants.

This indicates that working participants tend to live off-campus and in living situations that have a higher cost of living.

```
[7]: df.groupby('Do you currently live in a house, apartment, or dorm?').size().
     ↪plot(kind='barh',

                                                                                    ⊔
     ↪color=sns.palettes.mpl_palette(

                                                                                    ⊔
     ↪    'Dark2'))
     plt.gca().spines[['top', 'right', ]].set_visible(False)
```

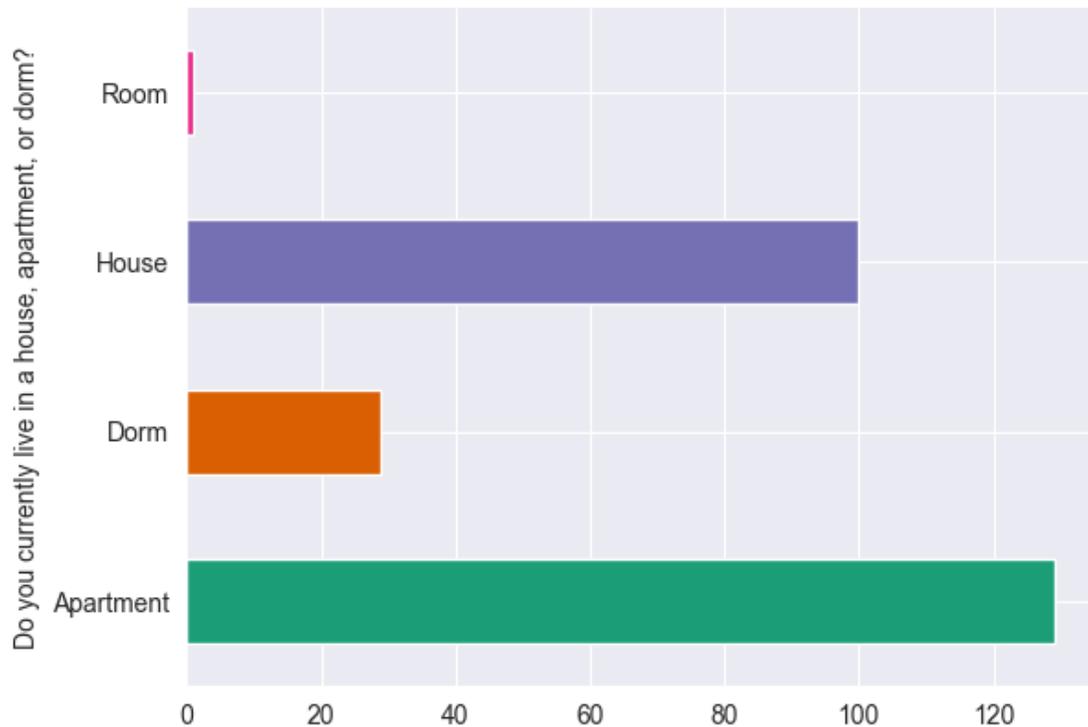

Most participants live in either an Apartment or a House. This would indicate that most students either live off-campus or on-campus apartments.

```
[8]: dataTable1 = pd.pivot_table(data=df, values='What was your GPA your very first⊔
     ↪quarter at UCR?',
```

```
                                index='How many hours do you work per week on␣
    ↪average?', aggfunc='mean')
    _ = dataTable1.plot(kind='bar')
    print("Total Average GPA: ", df['What was your GPA your very first quarter at␣
    ↪UCR?'].mean())
```

Total Average GPA: 3.6520247933884296
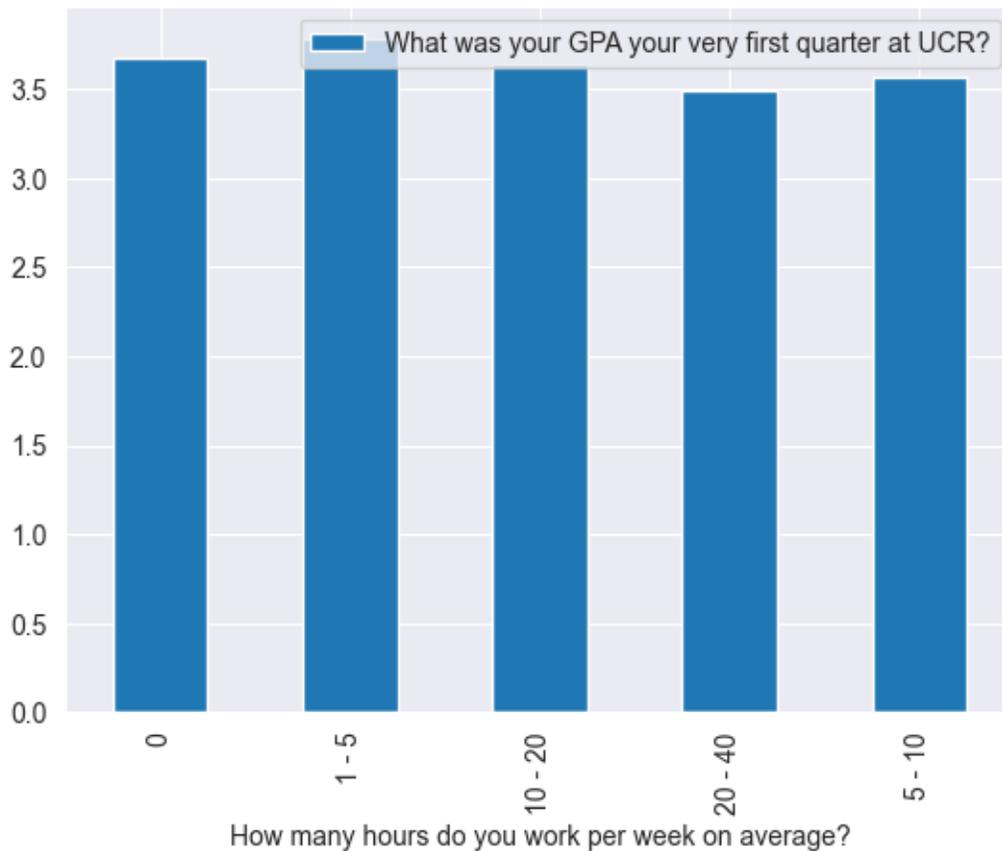

The average GPA seems to be independent in respect to working hours per week. Most students who work less than 20 hours have an equivalent average GPA to the total average GPA of all participants (3.65).

There is a small drop in GPA associated with students who work more than 20 hours (3.5 GPA), which may mean some of those students may struggle maintaining balance between work and school.

This would indicate that most students seem to be able to balance work with school. However, it would also indicate that students who work full-time jobs may struggle slightly in school.

```
[9]: stkbar_df = df.dropna()
     _ = pd.crosstab(
```

```
    df['Do you have family members who have careers related to your career␣
 ↪aspirations?'],
    df['What are your career plans right after graduation?'],
    normalize='index'
).plot(kind="bar", stacked=True, rot=0, figsize=(30, 15))
```

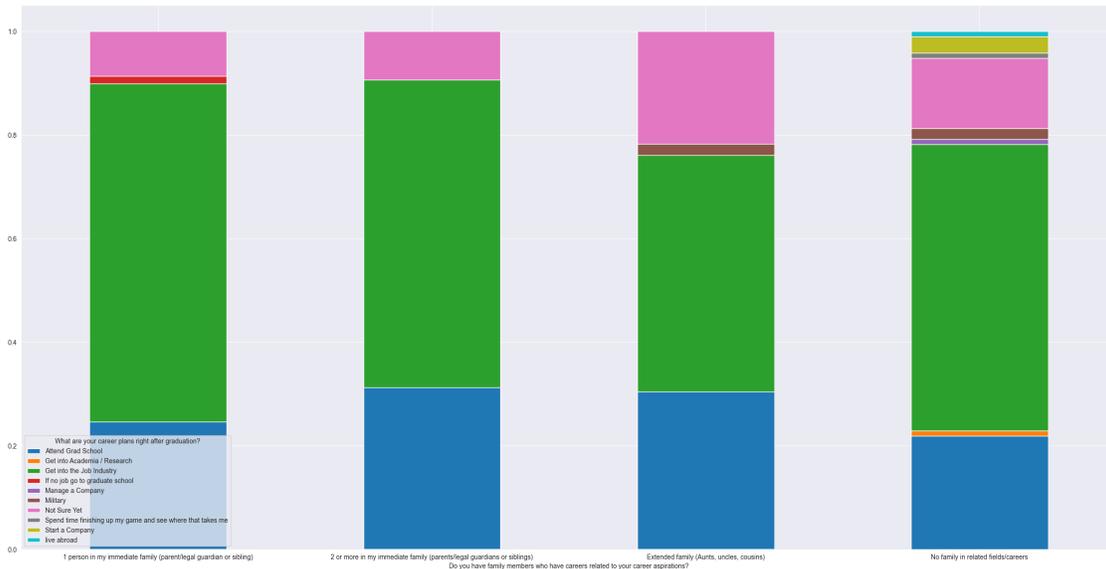

Most students across all groups are looking to "get into the job industry". Across all groups, the proportions of "Attending Grad School" and "Get into the job industry" are similar, except for students who have extended family in their career. They are more unsure about their future compared to other groups. Also, students with no family in their field are more diversified in their career plans.

```
[10]: fig, axes = plt.subplots(nrows=1, ncols=2, figsize=(10, 5))

_ = pd.crosstab(
    df['What is your current class standing?'],
    df['Do you currently work?'],
).plot(kind='bar', stacked=True, ax=axes[0])
_ = pd.crosstab(
    df['What is your current class standing?'],
    df['Do you currently work?'],
    normalize='index'
).plot(kind='bar', stacked=True, ax=axes[1])
```
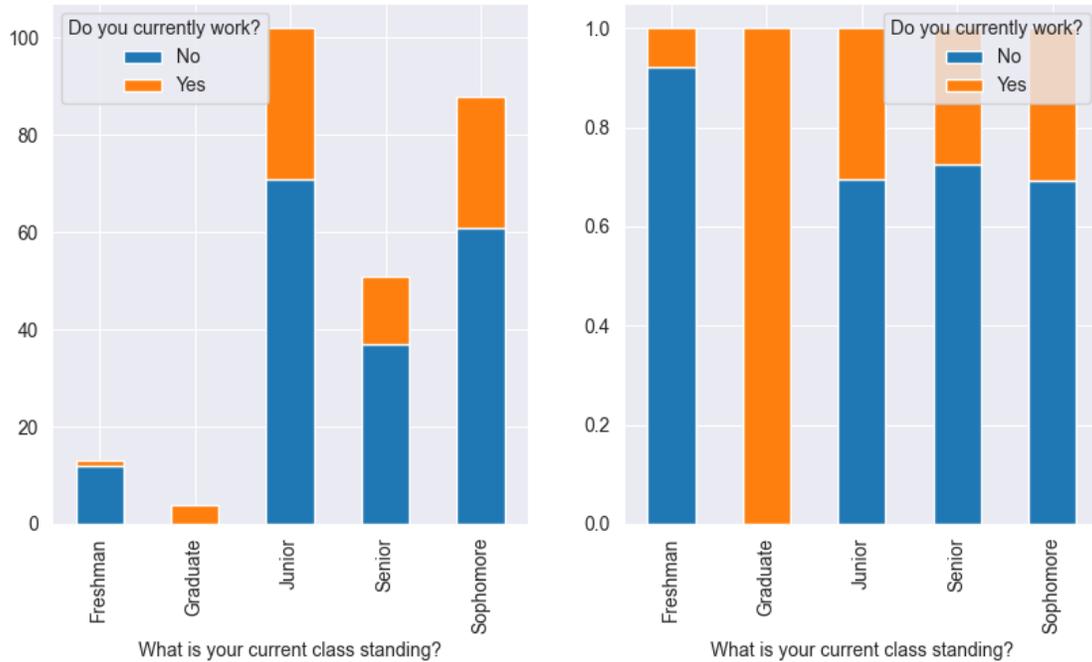

The class standing most likely to work are graduate students, where 100% of participants work. The freshman class is the least likely to work, where 92% of participants do not work.

For Sophomore, Junior, and Senior participants, all 3 groups have similar proportions working with 30% of participants working.

```python
[11]: fig, axes = plt.subplots(nrows=1, ncols=2, figsize=(10, 5))

_ = pd.crosstab(
    w_df['What is your current class standing?'],
    w_df['Do you work in a department related to your major?'],
).plot(kind='bar', stacked=True, ax=axes[0])

_ = pd.crosstab(
    w_df['What is your current class standing?'],
    w_df['Do you work in a department related to your major?'],
    normalize='index',
).plot(kind='bar', stacked=True, ax=axes[1])
```
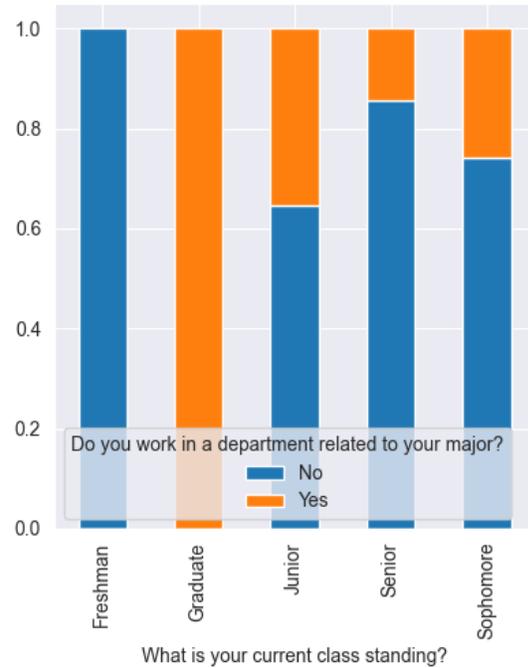

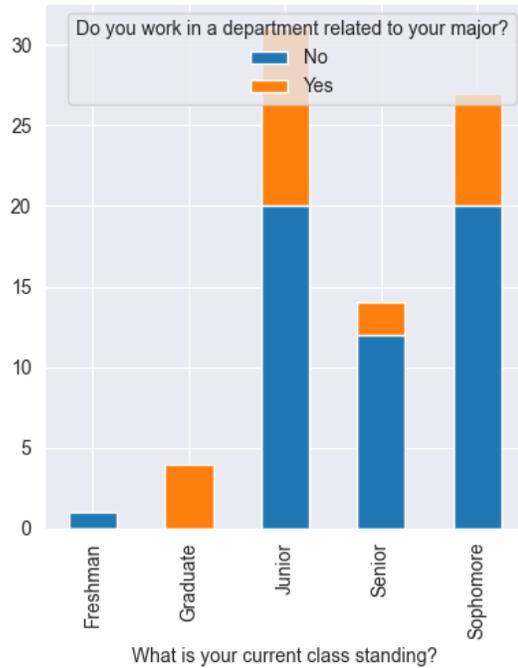

Of the students who responded "yes" to currently working, the above graphs show the proportions of participants who work in a department related to their major. Most students do not work in a department related to their major, indicating that they are working for money rather than job experience. his holds true for all groups except for Graduate students, who all work in a department of their major.

Interestingly, Juniors have a higher rate of working in their major, perhaps indicating internships or students seeking to gain major-related work experience.

```
[12]: _ = sns.violinplot(x=df["How many internship/job applications have you sent out
      ↪so far?"])
```
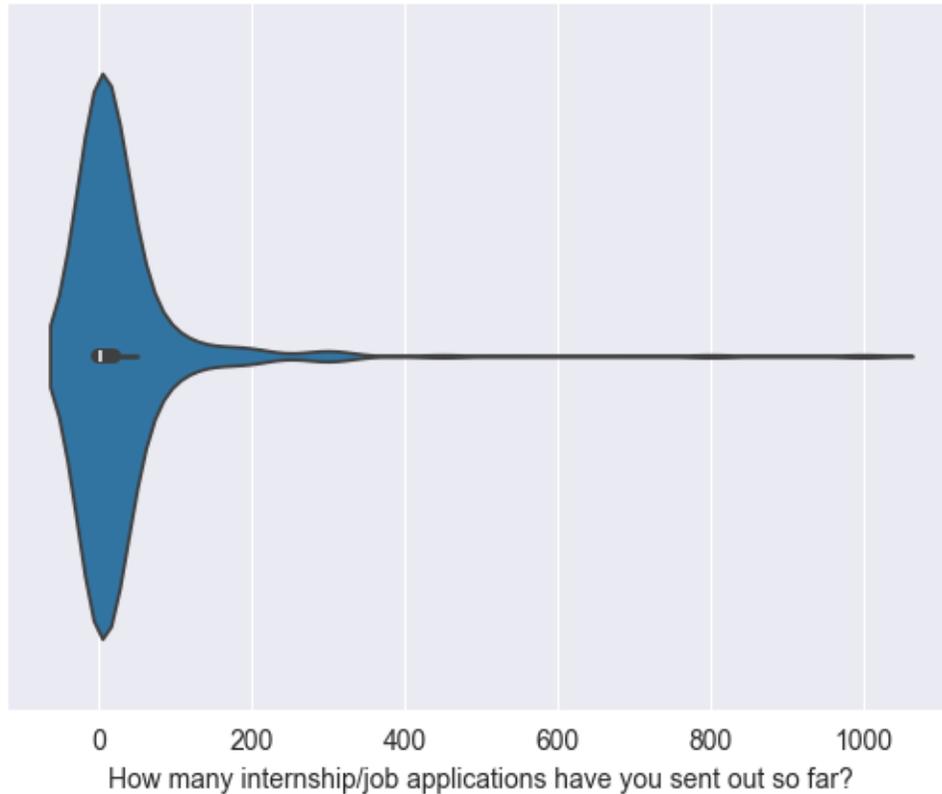

From the violin plot, we can see that students send out many job applications Some students have sent out many (up to 1000) applications. The distribution is skewed right with many outliers who have sent out significantly more applications than most students.

3.1 Hypotheses

4 Hypothesis 1: There will be a correlation between whether people live with family, friends, or neither and whether or not they work

Null Hypothesis: There is no relationship between people who live with family, friends, or neither and whether or not they work.

Significance value: 0.1 Degrees of freedom: 3

```
[13]: hyp3_major_table = pd.crosstab(df.iloc[:, 3], df.iloc[:, 8], margins=True,␣
      ↪margins_name='Total')
      hyp3_major_table
```

```
[13]: Do you currently work?   No  Yes  Total
      Who do you live with?
```

```
Both                           22     5     27
Family                         61    33     94
Friends                        57    27     84
Neither                        42    12     54
Total                         182    77    259
```

[14]:
```python
num_rows, num_cols = hyp3_major_table.shape
# Initialize expected frequencies
expected_frequencies = []
chi_squared = 0
for i in range(num_rows - 1):
    row_totals = hyp3_major_table.iloc[i, -1]
    for j in range(num_cols - 1):
        col_totals = hyp3_major_table.iloc[-1, j]
        expected_frequency = (row_totals * col_totals) / hyp3_major_table.
 ↪iloc[-1, -1]
        expected_frequencies.append(expected_frequency)
        chi_squared += ((hyp3_major_table.iloc[i, j] - expected_frequency) **␣
 ↪2) / expected_frequency

print("Chi-squared value:", chi_squared)
```

```
Chi-squared value: 4.616203438011947
```

With a significance value of 0.1 and 3 degrees of freedom, chi-squared must be greater than 6.25. Since chi-squared of `4.61 < 6.25`, we accept the null hypothesis:

There is no relationship between people who live with family, friends, or neither and whether or not they work.

4.0.1 Hypothesis 2: Students who live on-campus are more likely to have roommates of the same major.

Null Hypothesis: There is no relationship between students who live on-campus and students who have roommates of the same major.

Significance value: 0.1 Degrees of Freedom: 2

[15]:
```python
roommates_major_table = pd.crosstab(df.iloc[:, 4], df.iloc[:, 11],␣
 ↪margins=True, margins_name='Total')
roommates_major_table
```

[15]:
```
Do you work in a department related to your major?  No   Yes   Total
Do you currently live in a house, apartment, or…
Apartment                                           22    16      38
Dorm                                                 4     1       5
House                                               27     7      34
Total                                               53    24      77
```

```
[16]: num_rows, num_cols = roommates_major_table.shape
      # Initialize expected frequencies
      expected_frequencies = []
      chi_squared = 0
      for i in range(num_rows - 1):
          row_totals = roommates_major_table.iloc[i, -1]
          for j in range(num_cols - 1):
              col_totals = roommates_major_table.iloc[-1, j]
              expected_frequency = (row_totals * col_totals) / roommates_major_table.
        ↪iloc[-1, -1]
              expected_frequencies.append(expected_frequency)
              chi_squared += ((roommates_major_table.iloc[i, j] - expected_frequency)␣
        ↪** 2) / expected_frequency

      print("Chi-squared value:", chi_squared)
```

Chi-squared value: 4.183390044200403

With a significance value of 0.1 and 2 degrees of freedom, chi-squared must be greater than 4.61.
Since chi-squared of `4.18 < 4.61`, we accept the null hypothesis:

There is no relationship between students who live on-campus and students who have roommates
of the same major.

4.0.2 Hypothesis 3: People who live with more people will have a higher GPA on average.

```
[17]: hyp3_major_table = pd.crosstab(df.iloc[:, 5], df.iloc[:, 6], margins=True,␣
        ↪margins_name='Total')
      average_household_size = df.iloc[:, 5].mean(skipna=True)
      average_gpa = df.iloc[:, 6].mean(skipna=True)

      print("Average Household Size:", average_household_size)
      print("Average GPA:", average_gpa)
      numerator = 0
      denom_x = 0
      denom_y = 0
      for i in range(260):
          x_i = df.iloc[i, 5]
          y_i = df.iloc[i, 6]
          if not pd.isna(x_i) and not pd.isna(y_i):  # Check for NaN values
              numerator += (x_i - average_household_size) * (y_i - average_gpa)
              denom_x += (x_i - average_household_size) ** 2
              denom_y += (y_i - average_gpa) ** 2

      # Calculate Pearson correlation coefficient
      pearson_coefficient = (numerator / ((denom_x * denom_y) ** 0.5))
      print("Pearson Correlation Coefficient:", pearson_coefficient)
```

```
Average Household Size: 3.826923076923077
Average GPA: 3.6520247933884296
Pearson Correlation Coefficient: -0.2010052294084673
```

With a Pearson Correlation Coefficient of -0.2, there is a slight negative correlation between household size and average GPA. Students who live alone or with fewer people perform slightly better than those with more roommates.

This goes against our hypothesis that people living with more people will have a higher GPA.

5 Conclusion

In wanting to figure out in general how various aspects of a student's home environment go on to affect their employment and school performance, we performed 3 different tests: Comparing what kind of people participants lived with and whether or not they work, students who work on campus and their roommates majors, and the number of people participants lived with and the participant's GPA. However, using chi-squared tests and pearson correlation, we discovered that none of our hypotheses had any correlation with it. But from here we can delve deeper into our hypothesis, for example why did working not affect student's GPA's in the first quarter? What are other potential factors as to why that was the case? In addition, Freshmen were found to not work at major related jobs, whereas juniors were the most likely to work at a major related job.

Even though none of our hypotheses were proven to be true, we still learned a lot about the data given to us and we can use it to further more questions and assumptions later down the line.
